Assignment 9.5: Responsive Landing Page (Finish & Review)

Goal: take the 9.4 desktop page and make it fully responsive, tested, clean and pushed to GitHub.

1. Tablet and mobile breakpoints

```
/* Tablet */
@media (max-width: 1023px) {
  .cards { grid-template-columns: repeat(2, 1fr); }
  .hero-inner { gap: 2.5rem; }
}
/* Mobile */
@media (max-width: 767px) {
  .hero-inner { grid-template-columns: 1fr; }
  .cards { grid-template-columns: 1fr; }
  .hero-actions { flex-direction: column; }
}
```

The finished starter keeps the desktop styles as the base and uses max-width queries to scale down. A mobile-first rewrite with min-width queries works equally well.

2. Navbar for small screens

Hide the menu behind a hamburger button below 768px and toggle it with a few lines of JavaScript. Use aria-expanded so it is accessible.

```
<button class="nav-toggle" aria-expanded="false" aria-controls="primary-nav"
        aria-label="Toggle menu">...</button>

.nav-toggle { display: none; }
@media (max-width: 767px) {
  .nav-toggle { display: flex; }
  .nav { display: none; position: absolute; top: 100%; left: 0; right: 0; }
  .nav.is-open { display: flex; flex-direction: column; }
}

toggle.addEventListener('click', () => {
  const open = nav.classList.toggle('is-open');
  toggle.setAttribute('aria-expanded', open);
});
```

3. Responsive typography and images

```
.hero h1 { font-size: clamp(2rem, 1.3rem + 3vw, 3rem); }
img { max-width: 100%; height: auto; display: block; }
```

4. Test buttons and links

- Click every nav link and button; each should scroll to a real section id or go to a real URL.
- Replace placeholder href="#" links with real targets.
- Check hover and focus states, and that the hamburger opens and closes.
- Make sure the mobile menu closes after a link is clicked.

5. Test viewport sizes in Chrome DevTools

- Open DevTools (F12), then Device Mode (Ctrl+Shift+M).
- Check 375px (phone), 768px (tablet) and 1280px+ (desktop), then drag the width slowly between them.
- Look for horizontal scrolling, overlapping elements, broken images and uneven spacing.
- Capture screenshots with the three-dot menu, then Capture full size screenshot.

6. Common fixes

- **Horizontal scroll:** remove fixed widths, add box-sizing: border-box, overflow-wrap: break-word.
- **Broken images:** check file paths and names (case-sensitive on GitHub Pages).
- **Overlap:** use gap instead of negative margins, and flex-wrap on rows.
- **Spacing:** reduce section padding on mobile (about 2.5rem).

7. Clean code

- Consistent 2-space indentation and lowercase class names.
- Group CSS by section (base, buttons, navbar, hero, features, breakpoints).
- Remove unused styles and commented-out code; keep alt text on all images.
- Validate with validator.w3.org if possible.

8. Push final changes to GitHub

```
git add .
git commit -m "Finish responsive landing page"
git push
```

Optional: enable GitHub Pages (Settings, then Pages) to add a live link to your README.

Submission checklist

- Final responsive landing page (index.html, style.css, images)
- Screenshots: desktop, tablet, mobile
- Updated GitHub repository link
